A	**Purpose**
B	**Scope**
C	**Policy**
D	**After care of Patients**

©Hope Hospital

A. Purpose: To provide guideline for uniform resuscitation of patient throughout the organization.

B. Scope: Hospital wide.

C. Policy Guideline:

- Assess the condition of the patient to ascertain the need of CPR.
- Assess the responsiveness by shaking and calling the patient.
- Assess the cardiac and respiratory status of the patient (Presence of respiration and pulse) and previous history of cardiac arrest.
- Check that CPR kit is complete.
- Follow the steps of ABC of basic life support.
- Ensures the safety of self and the victim.
- Place the patient on hard surface in supine position and rescuer also in correct position.
- Make sure that airway is cleared by proper position (Hyperextension of head & neck) and artificial dentures are removed.
- Initiate ambu if breathing not restored.
- Ensure the closing of nostrils of victim with thumb and index finger and enclosing his mouth with rescuers mouth to maintain the airtight seal for effective ventilation of lungs.
- Repeat the procedure 12-20 times at the rate of one inflation every 3-5 secs.
- Ensure the inflation of lungs corresponds to the respiration of the victim.
- If victim is pulse less, give cardiac compression following initial four rapid breaths to maintain circulation.
- Correct location of lower half of the sternum when cardiac compression is used.
- Artificial breathing cardiac massage corresponds to normal respiration and pulse rate 30:2.(cardiac massage: breathing)
- Ensure the establishment of respiration and circulation: constriction of pupils, regular pulse, normal B.P, normal skin colour & rhythmic respiration.
- Observe for any complications: Sternal and rib fracture pneumothorax.
- Document the procedure, date, time, method and response of patient.

D. After care of patient

- Make the patient comfortable.
- Observe for any complication again and take appropriate action.
